The cognitive theory of translation and its basic concepts.

Linguistics has been taken up as a field of research in cognitive science, as the evolution of language and its continuous development is because of some processes taking place in mind. For example thinking to speak or communicate, taking initiative to talk, finding some tools or objects to communicate, etc., all are related to cognition i.e. related to mind and its various processes. Linguistics and cognitive sciences is an important branch of science and it has led to various discoveries regarding the language development. How is the accent of any language or the body of its words are generated and what it takes for any mind to adapt to it.

Actually linguistics is a scientific study of any language dealing with phonetics, pronunciation, listening, and other similar scientific aspects whereas cognitive linguistics is the study of what process is going in the mind when someone is speaking, listening or just using any language. We can say that linguistics differs from language to language but cognitive science can be the same for different languages. Linguistics is a generative and module based study of any language e.g. it is concerned only about correct usage, rules, grammar etc. but on the other hand, cognitive science of language deals with the concept lying behind any language.
